INTRODUCTION

Cervical cyst or naboth cyst is common and benign gynecological finding in women of reproductive age. Generally without clinical significance. They are result of the retention cyst that develops when the mucus gland of the cervix is obstructed . This retention is caused by chronic inflammation after minor trauma. cervical cyst are not cancerous. Which form when normal tissue on the outer part of cervix

Grows over the glandular, mucus – producing tissue of the inner part of the

service, when the mucus, fluid or tissue become trapped a cyst form.

Many a time in female there are formation of minute cyst on surface of cervix which are called as Nabothian cyst. They are vary in size & can range form 1mm to above 4 cm in size. They are usually yellow or white in colour.
